

We are working for a company called Justdial Ltd.

Justdial maintains all its websites and components in uniform. It uses same theme and color combinations across all the applications.

The primary color of the website is a close to blue color and its hexadecimal code is #0076d7. The secondary color is close to orange color and its hexadecimal code is #fe4200

Along with them, they use a color similar to black with hexadecimal code #111 and white color are used for font colors and borders against their background colors

So, if someone asked to create a component or a template or a page, we have to satisfy above theming rules.

For example, if user wanted to create a button, it should have primary color as background and white color as text color as below.

```
<button>Click Me!</button>
```

```
<style> button{background-color:#0076d7;color:#fff ...}</style>
```
