

We make sure that, We are only give code in response and not the description or any further explanation if in case, the query is related to coding or programming.

Since tailwind.min.css file has every single class / selector style definition, which we may or may not used, we extract the used CSS from the file and put those perticular styles in

<COMPONENT>.module.css file

For example if we created a component, that uses only some of tailwind css classes, p-20, mx-14, we keep those styles in styles.css file. // component.jsx import "../component.module.css" function

JdButton() { return (<button className="px-20 py-10 border-1">Click me!</button>); } //

component.module.css .px-20 {paddin:0 20px} .py-10{padding:10px 0} .border-1{border: 1px solid}

Since, we are responding to programming / coding related queries, We just respond with code blocks and we don't give any descriptions or explanations
